

MS SQL Server backup

Automated, reliable and secure offsite backups

- No downtime for backup of the SQL databases
- Easy to deploy and administer

Why backup your databases?

The information you gather is not only vital for your ongoing business, but also important in sketching future business strategies. Company databases are living documents that continually grow and change to meet evolving business needs. Your MS SQL Server is an integral component of business critical applications like customer relationship management, enterprise resource planning, supply chain management, financial record, asset management, etc. The need for databases accessibility goes far beyond standard business hours. Administrators of organizational databases need an effective way to minimize downtime and maintain current backups of the database.

Imagine losing your valuable databases to files corruption or file sabotage! What if they were mistakenly deleted or truncated, or how will you save your data if your office was struck by a natural disaster?

These are not prophecies but real-life scenarios that could bring your business to its knees.

Does your business have a backup plan?

The IBackup solution for MS SQL Server

IBackup's enterprise-class solution provides peace of mind to businesses by securely backing up and restoring their databases without interruption.

It takes full advantage of the embedded capabilities within MS SQL Server's backup and restore functions, to enable fast and reliable data transfers. Online backup is easily configured and can be scheduled to occur hourly, daily, or weekly. Restore functions include restore of previous versions of specified databases to allow access to versions before a corruption hits.
