

IBackup Professional™

HOW LONG WOULD YOU LAST WITHOUT YOUR COMPUTER?

What do you use your computer for? Check e-mail? Write proposals? Prepare a quote? What happens if your business data fell into the wrong hands? Do you carry sensitive patient or client data? What if you can't access your hard drive? Do you back up your computer data often? The information you've worked to gather over the years in business could be lost in seconds with recovery expensive or perhaps impossible. Why suffer this devastation when you don't have to? Why not have backups done daily, safe & automatic over secured access approved for both medical and legal professionals?

IBackup Professional provides a safe and secure means for storing all your sensitive business data using your broadband Internet connection. Encrypted to your password and transmitted using SSL, IBackup Professional assists professionals and enterprises in meeting the stringent standards established for regulatory compliance. IBackup's solutions answer security concerns by keeping backup data always encrypted and immediately available. Centralized management of the data protection process for faster and easier response to auditor inquiries.

You'll rest easier knowing that in the event of a data disaster, you'll be able to restore all the data, you've gathered over the years. From anywhere you can access the data through Internet, safely, securely and easily.

AUTOMATICALLY SAVE ALL YOUR CRUCIAL BUSINESS DATA

IBackup Professional

Features:

- ▶ Secure 128 Bit SSL encryption
- ▶ Stored with user password key; AES 256 Bit Encryption
- ▶ Data Compression in transmission
- ▶ Centralized Management
- ▶ Geographic redundancy built-in by having user data mirrored between data centers*
- ▶ Online MS SQL/MS Exchange/Brick-level backups
- ▶ Backup of open files such as Microsoft Outlook (.pst) files etc.
- ▶ Incremental backups of file modifications
- ▶ Schedule backups
- ▶ Bandwidth Throttle
- ▶ Document history; retains 30 backed up versions

System Requirements:

- ▶ Microsoft Windows Vista/XP/NT/2000, Me/98 SE, Windows 2000 Advanced Server, Windows 2003 Server.
- ▶ 512 MB RAM.
- ▶ 10 MB Free Hard Disk space for installed program.
- ▶ Recommend 20 MB or more for local caching.
- ▶ Internet Explorer 6 is highly recommended.

YOU CAN PLAN AHEAD, OR LAG BEHIND.
STAY AHEAD WITH IBACKUP PROFESSIONAL

IBackup Professional

Product Feature and Benefits:

- **Security:** Backed up data files are encrypted using 256-bit AES encryption and use 128-bit SSL during transmission. The data files are automatically decrypted during restore operations. The encryption is done based on a user defined key, so the data stored on IBackup Professional servers cannot be decrypted by anybody other than you.
- **File Versioning:** Each backup creates a new backup set identified by the backup date and time. Users can restore up to 30 prior file/backup set versions including the most recent version of their data files. Users can also restore latest versions of all their files or versions of files as of a specific backup set.
- **Fast and Efficient Backups:** IBackup Professional efficiently uses data compression during transmission. Incremental backups are done by transferring only the modified portions of a file that was previously backed up.
- **Online MS SQL / MS Exchange server and MS Exchange Server Brick-Level backups:** This feature is truly beneficial since it allows you to perform backups of your running databases without any downtime as most system administrators/database administrators have the necessity to maintain minimum downtime on their databases and this feature fits easily into their IT strategy of database backup/recovery. Further, they can backup individual emails using the brick-level backup feature of IBackup Professional.
- **Centralized Management:** This feature helps to set up user accounts, manage user quota and also provides reports on backup and recovery logs. This reporting feature is very useful for auditors to ascertain when the information was created, thus allowing to maintain a trail of transactions. An additional feature here is the concept of managed backups where backup status reporting as of the last 7-days is done.

SERIOUS DATA PROTECTION FOR SERIOUS BUSINESS

- **Geographic redundancy built-in by having user data mirrored between data centers*:** This feature enables user data account to be mirrored between two geographically dispersed data centers for additional protection. This ensures your data is always at your fingertips when you need it the most.
- **Proxy Friendliness:** Advanced settings enable users to setup connections via proxy servers to be able to connect to IBackup Professional servers and perform backups.
- **Automatic Selection:** The 'Automatic Selection' will select the list of 'most commonly used user data' and the 'most common application data types' that need backup.
- **Sync:** The 'Sync' feature lets you match the contents of your IBackup Professional account to exactly the same as that on your 'My Computer' for the selected files/folders existing on your IBackup Professional account.
- **Bandwidth Throttle:** During backup, performance of other Internet applications may be adversely affected. To circumvent this, users can reduce the application bandwidth and access other Internet applications without any interruptions.
- **Efficient Storage Computation:** Total storage space is calculated only for the latest version of any file and is not based on historical versions.
- **Open file backups:** This feature enables you to perform backup of open files such as Microsoft PST files and Lotus Notes NSF files effortlessly. Many times, applications keep these files open for exclusive usage due to which backup solutions skip those files that are in use. This is extremely handy to ensure that you continue using your Outlook while the backup client agent is running.
